Soil clay mineralogy using XRD profile modeling

<2.0 μm fraction Sfe horizon / Cambisol – France (EG)

Adapted from Hubert et al. (2012, *Amer. Miner.*, 97, 384)

Soil clay mineralogy

- **Qualitative** agreement is **NOT sufficient** to provide an accurate description of soil clay mineralogy
- **Quantitative profile fitting is essential** (at least to assess how close/far your identification is from a realistic description of your sample)
- Quantitative profile fitting is **possible** on natural samples
- The improved/novel description of the data provides key constraints on the actual nature of reactions and processes taking place in natural environments
